Make a fresh React Application which must have:

1. Login Page (either call API or call async function to get the dummy static response)
2. Signup Page (just simple page without API calls but maintain the states)
3. A User Profile Page which can only be seen after logging in.

While doing the assignment keep in mind:

1. You make reusable component
2. Code is well structured and maintained i.e. code splitting and refactoring is done.
3. Write less complex code
4. Routing must be done
5. You can use localStorage for keeping the response from the login API for authentication purpose

*note: you will be using this project for further assignments
